

Project 3 — Milestone

Phase A

Project 3 milestone

Phase A in: [Project 3 — Discovering Patterns](#)

Milestone notebook

[Open in Colab](#)

Complete Phase A in the notebook before you build all ten plots and the one-page summary (Phase B). Submitting the milestone to Canvas is optional.

What this checkpoint is for

This check lets you confirm your dataset loads before you invest time in graphs and the full report. Do not make univariate or bivariate plots, compute Pearson r , or write the one-page summary yet, those are Phase B.

Why choose the dataset and variables before you plot?

In [Module 0, Read 0](#), the five-step statistical process puts planning before collecting. Step 2 is to decide what you will analyze and how — before Step 4 (analyze). Phase A is your Step 2 for Project 3: pick a documented dataset, load it in R, inspect it with `glimpse()`, and name four variables with types and descriptions from the data dictionary.

Phase A — complete in the notebook

Step	Task
A1	Choose a TidyTuesday week (or approved source). Paste the GitHub folder link and one-sentence description.
A2	Load the CSV in Colab (R runtime): <code>library(tidyverse) + read_csv("https://raw.githubusercontent.com/...").</code>
A3	Run <code>glimpse()</code> and <code>head()</code> to confirm the file loaded (rows, columns, types).
A4	From all columns in the dataset, choose four variables for Project 3. For each: name, description (from readme), type (categorical or numerical).

Loading instructions: [How to choose and load a TidyTuesday dataset](#) on the main Project 3 page.

What to turn in to Canvas (optional)

You may submit the milestone notebook showing:

1. TidyTuesday week link (or other source URL) and short dataset description (A1)
2. Working `read_csv()` code with the URL from the readme (A2)
3. Output of `glimpse()` (and optionally `head()`) — proof the data loaded (A3)
4. Table of four chosen variables: name, description, categorical vs numerical (A4)

After the milestone

Complete Phase B on the [Project 3 page](#):

1. Four univariate plots + summaries (one per focus variable)
2. Six bivariate plots (one per pair among your four variables)
3. One-page PDF with two chosen figures, four numeric facts, and four findings
4. Full notebook — uploaded to Canvas with the one-page PDF

Sample Phase B (not your dataset): [Palmer penguins example](#) · [sample PDF](#)
